

Firewall Rules — Monitoring Interface (VLAN 99, 10.10.99.0/24)

The Monitoring zone exists to receive **mirrored (SPAN) traffic** for the SIEM sensor. The sensor's monitor NIC sits here in promiscuous mode and should **never source routed traffic**. This is the most locked-down zone in the lab.

Aliases: RFC1918 .

#	Action	Proto	Source	Dest	Port	Description
1	Block (log)	any	MONITOR net	any	any	Sensor monitor NIC is receive-only

Security note: the monitor NIC does not even need an IP for raw packet capture, but VLAN 99 has a gateway so the interface can be administered if needed. We deny all traffic sourced from this zone — the sensor must be managed via its **second NIC on VLAN 10** (10.10.10.x), not from here. This enforces the production “management plane vs. capture plane” separation and prevents a compromised sensor from using the capture interface to pivot.

Mirrored frames arrive at L2 (they are not routed by pfSense), so no “pass” rule is required for the SPAN feed itself — see `../port-mirror.md` and `../../proxmox/bridge-mirror.md` .
